
CKIPNLP

Release v0.6.4

Feb 13, 2020

1	Introduction	1
1.1	Git	1
1.2	PyPI	1
1.3	Documentation	1
1.4	Author / Maintainer	1
1.5	Requirements	1
2	Installation	3
2.1	Install Using Pip	3
2.2	Installation Options	4
3	Usage	5
3.1	CKIPWS	5
3.2	CKIPParser	5
3.3	Utilities	6
4	FAQ	7
5	License	9
6	ckipnlp.ws package	11
7	ckipnlp.parser package	13
8	ckipnlp.util package	15
8.1	Submodules	15
9	Todo List	21
10	Index	23
11	Module Index	25
	Python Module Index	27
	Index	29

1.1 Git

<https://github.com/ckiplab/ckipnlp>

1.2 PyPI

<https://pypi.org/project/ckipnlp>

1.3 Documentation

<http://ckipnlp.readthedocs.io/>

1.4 Author / Maintainer

- Mu Yang at CKIP (Author & Maintainer)
- Wei-Yun Ma at CKIP (Maintainer)

1.5 Requirements

- Python 3.5+

- [Cython](#) 0.29+
- [TreeLib](#) 1.5+

Attention: For Python 2 users, please use PyCkip 0.4.2 instead.
--

1.5.1 CKIPWS (Optional)

- [CKIP Word Segmentation](#) Linux version 20190524+

1.5.2 CKIPParser (Optional)

- [CKIP Parser](#) Linux version 20190506+ (20190725+ recommended)

CHAPTER 2

Installation

Denote `<ckipws-linux-root>` as the root path of CKIPWS Linux Version, and `<ckipparser-linux-root>` as the root path of CKIPParser Linux Version.

2.1 Install Using Pip

```
pip install --upgrade ckipnlp
pip install --no-deps --force-reinstall --upgrade ckipnlp \
  --install-option='--ws' \
  --install-option='--ws-dir=<ckipws-linux-root>' \
  --install-option='--parser' \
  --install-option='--parser-dir=<ckipparser-linux-root>'
```

Ignore ws/parser options if one doesn't have CKIPWS/CKIPParser.

2.2 Installation Options

Option	Detail	Default Value
--[no-]ws	Enable/disable CKIPWS.	False
--[no-]parser	Enable/disable CKIP-Parser.	False
--ws-dir=<ws-dir>	CKIPWS root directory.	
--ws-lib-dir=<ws-lib-dir>	CKIPWS libraries directory	<ws-dir>/lib
--ws-share-dir=<ws-share-dir>	CKIPWS share directory	<ws-dir>
--parser-dir=<parser-dir>	CKIPParser root directory.	
--parser-lib-dir=<parser-lib-dir>	CKIPParser libraries directory	<parser-dir>/lib
--parser-share-dir=<parser-share-dir>	CKIPParser share directory	<parser-dir>
--data2-dir=<data2-dir>	“Data2” directory	<ws-share-dir>/Data2
--rule-dir=<rule-dir>	“Rule” directory	<parser-share-dir>/Rule
--rdb-dir=<rdb-dir>	“RDB” directory	<parser-share-dir>/RDB

See <http://ckipnlp.readthedocs.io/> for API details.

3.1 CKIPWS

```
import ckipnlp.ws
print(ckipnlp.__name__, ckipnlp.__version__)

ws = ckipnlp.ws.CkipWs(logger=False)
print(ws(''))
for l in ws.apply_list(['', '']): print(l)

ws.apply_file(ifile='sample/sample.txt', ofile='output/sample.tag', uwfile='output/
↪sample.uw')
with open('output/sample.tag') as fin:
    print(fin.read())
with open('output/sample.uw') as fin:
    print(fin.read())
```

3.2 CKIPParser

```
import ckipnlp.parser
print(ckipnlp.__name__, ckipnlp.__version__)

ps = ckipnlp.parser.CkipParser(logger=False)
print(ps(''))
for l in ps.apply_list(['', '']): print(l)

ps = ckipnlp.parser.CkipParser(logger=False)
print(ps(''))
```

(continues on next page)

(continued from previous page)

```
for l in ps.apply_list(['', '']): print(l)
ps.apply_file(ifile='sample/sample.txt', ofile='output/sample.tree')
with open('output/sample.tree') as fin:
    print(fin.read())
```

3.3 Utilities

```
import ckipnlp
print(ckipnlp.__name__, ckipnlp.__version__)

from ckipnlp.util.ws import *
from ckipnlp.util.parser import *

# Format CkipWs output
ws_text = ['(Na) (T)', '(I) (D)']

# Show Sentence List
ws_sents = WsSentenceList.from_text(ws_text)
print(repr(ws_sents))
print(ws_sents.to_text())

# Show Each Sentence
for ws_sent in ws_sents: print(repr(ws_sent))
for ws_sent in ws_sents: print(ws_sent.to_text())

# Show CkipParser output as tree
tree_text =
↳ 'S(theme:NP (property:N(head:Nhaa:|Head:DE:)|Head:Nad(DUMMY1:Nab:|Head:Caa:|DUMMY2:Naa:))|quantity:I
↳ '
tree = ParserTree.from_text(tree_text)
tree.show()

# Get dummies of node 5
for node in tree.get_dummies(5): print(node)

# Get heads of node 1
for node in tree.get_heads(1): print(node)

# Get relations
for rel in tree.get_relations(0): print(rel)
```

CHAPTER 4

FAQ

Danger: Due to C code implementation, both `CkipWs` and `CkipParser` can only be instance once.

Tip: The CKIPWS throws “what(): locale::facet::_S_create_c_locale name not valid”. What should I do?

Install locale data.

```
apt-get install locales-all
```

Tip: The CKIPParser throws “ImportError: libCKIPParser.so: cannot open shared object file: No such file or directory”. What should I do?

Add below command to `~/ .bashrc`:

```
export LD_LIBRARY_PATH=<ckipparser-linux-root>/lib:$LD_LIBRARY_PATH
```

CHAPTER 6

ckipnlp.ws package

class ckipnlp.ws.**CkipWs** (*, logger=False, inifile=None, **kwargs)

Bases: object

The CKIP word segmentation driver.

Parameters

- **logger** (*bool*) – enable logger.
- **inifile** (*str*) – the path to the INI file.

Other Parameters ** – the configs for CKIPWS, ignored if **inifile** is set. Please refer `ckipnlp.util.ini.create_ws_ini()`.

Danger: Never instance more than one object of this class!

apply (*text*)

Segment a sentence.

Parameters **text** (*str*) – the input sentence.

Returns *str* – the output sentence.

Hint: One may also call this method as `__call__()`.

apply_list (*ilist*)

Segment a list of sentences.

Parameters **ilist** (*List[str]*) – the list of input sentences.

Returns *List[str]* – the list of output sentences.

apply_file (*ifile, ofile, uwfile=""*)

Segment a file.

Parameters

- **ifile** (*str*) – the input file.
- **ofile** (*str*) – the output file (will be overwritten).
- **uwfile** (*str*) – the unknown word file (will be overwritten).

class `ckipnlp.parser.CkipParser` (*, *logger=False*, *infile=None*, *wsinfile=None*, ***kwargs*)

Bases: `object`

The CKIP sentence parsing driver.

Parameters

- **logger** (*bool*) – enable logger.
- **infile** (*str*) – the path to the INI file.
- **wsinfile** (*str*) – the path to the INI file for CKIPWS.

Other Parameters

- ** – the configs for CKIPParser, ignored if **infile** is set. Please refer `ckipnlp.util.ini.create_parser_ini()`.
- ** – the configs for CKIPWS, ignored if **wsinfile** is set. Please refer `ckipnlp.util.ini.create_ws_ini()`.

Danger: Never instance more than one object of this class!

apply (*text*)

Segment a sentence.

Parameters **text** (*str*) – the input sentence.

Returns *str* – the output sentence.

Hint: One may also call this method as `__call__()`.

apply_list (*ilist*)

Segment a list of sentences.

Parameters *ilist* (*List[str]*) – the list of input sentences.

Returns *List[str]* – the list of output sentences.

apply_file (*ifile*, *ofile*)

Segment a file.

Parameters

- **ifile** (*str*) – the input file.
- **ofile** (*str*) – the output file (will be overwritten).

8.1 Submodules

8.1.1 ckipnlp.util.ini module

```
ckipnlp.util.ini.create_ws_ini(*, data2dir=None, lexfile=None, new_style_format=False,
                               show_category=True, sentence_max_word_num=80, **options)
```

Generate CKIP word segmentation config.

Parameters

- **data2dir** (*str*) – the path to the folder “Data2”.
- **lexfile** (*str*) – the path to the user-defined lexicon file.
- **new_style_format** (*bool*) – split sentences by newline characters (“\n”) rather than punctuations.
- **show_category** (*bool*) – show part-of-speech tags.
- **sentence_max_word_num** (*int*) – maximum number of words per sentence.

```
ckipnlp.util.ini.create_parser_ini(*, wsinfile, ruledir=None, rdbdir=None, do_ws=True,
                                   do_parse=True, do_role=True, sentence_delim=',', **options)
```

Generate CKIP parser config.

Parameters

- **ruledir** (*str*) – the path to “Rule”.
- **rdbdir** (*str*) – the path to “RDB”.
- **do_ws** (*bool*) – do word-segmentation.
- **do_parse** (*bool*) – do parsing.
- **do_role** (*bool*) – do role.

- **sentence_delim**(*str*) – the sentence delimiters.

8.1.2 ckipnlp.util.parser module

class ckipnlp.util.parser.ParserNodeData

Bases: tuple

A parser node.

role

str – the role.

pos

str – the post-tag.

term

str – the text term.

classmethod from_text(*text*)

Create a *ParserNodeData* object from *ckipnlp.parser.CkipParser* output.

to_text()

Transform to plain text.

to_dict()

Transform to python dict/list.

to_json(***kwargs*)

Transform to JSON format.

class ckipnlp.util.parser.ParserNode(*tag=None, identifier=None, expanded=True, data=None*)

Bases: *treelib.node.Node*

A parser node for tree.

data

Type *ParserNodeData*

See also:

treelib.tree.Node Please refer <https://treelib.readthedocs.io/> for built-in usages.

to_text()

Transform to plain text.

to_dict()

Transform to python dict/list.

to_json(***kwargs*)

Transform to JSON format.

class ckipnlp.util.parser.ParserRelation

Bases: tuple

A parser relation.

head

ParserNode – the head node.

tail

ParserNode – the tail node.

relation
str – the relation.

head_first

to_dict()
 Transform to python dict/list.

to_json(kwargs)**
 Transform to JSON format.

class ckipnlp.util.parser.**ParserTree** (*tree=None, deep=False, node_class=None*)
 Bases: `treelib.tree.Tree`

A parsed tree.

See also:

treelib.tree.Tree Please refer <https://treelib.readthedocs.io/> for built-in usages.

node_class
 alias of `ParserNode`

static normalize_text (*tree_text*)
 Text normalization for `ckipnlp.parser.CkipParser` output.
 Remove leading number and trailing #. Prepend `root :` at beginning.

classmethod from_text (*tree_text, *, normalize=True*)
 Create a `ParserTree` object from `ckipnlp.parser.CkipParser` output.

Parameters

- **text** (*str*) – A parsed tree from `ckipnlp.parser.CkipParser` output.
- **normalize** (*bool*) – Do text normalization using `normalize_text()`.

to_text (*node_id=0*)
 Transform to plain text.

to_dict (*node_id=0*)
 Transform to python dict/list.

to_json (***kwargs*)
 Transform to JSON format.

show (**, key=<function ParserTree.<lambda>>, idhidden=False, **kwargs*)
 Show pretty tree.

has_dummies (*node_id*)
 Determine if a node has dummies.

Parameters **node_id** (*int*) – ID of target node.

Returns *bool* – whether or not target node has dummies.

get_dummies (*node_id, deep=True, _check=True*)
 Get dummies of a node.

Parameters

- **node_id** (*int*) – ID of target node.
- **deep** (*bool*) – find dummies recursively.

Returns `Tuple[ParserNode]` – the dummies.

Raises `LookupError` – when target node has no dummy (only when `_check` is set).

get_heads (*root_id=0, deep=True*)
Get all head nodes of a subtree.

Parameters

- **root_id** (*int*) – ID of the root node of target subtree.
- **deep** (*bool*) – find heads recursively.

Returns

- List[*ParserNode*] – the head nodes (when **deep** is set).
- *ParserNode* – the head node (when **deep** is not set).

Todo: Get information of nodes with pos type PP or GP.

get_relations (*root_id=0*)
Get all relations of a subtree.

Parameters **root_id** (*int*) – ID of the subtree root node.

Yields *ParserRelation* – the relation.

8.1.3 ckipnlp.util.ws module

class `kipnlp.util.ws.WsWord`

Bases: `tuple`

A word-segmented word.

word

str – the word.

pos

str – the post-tag.

classmethod **from_text** (*text*)

Create a *WsWord* object from *kipnlp.ws.CkipWs* output.

Parameters **text** (*str*) – A word from *kipnlp.ws.CkipWs* output.

to_text ()

Transform to plain text.

to_dict ()

Transform to python dict/list.

to_json (***kwargs*)

Transform to JSON format.

class `kipnlp.util.ws.WsSentence` (*initlist=None*)

Bases: `collections.UserList`

A word-segmented sentence.

item_class

alias of *WsWord*

classmethod **from_text** (*text*)

Create *WsSentence* object from *kipnlp.ws.CkipWs* output.

Parameters **text** (*str*) – A sentence from *ckipnlp.ws.CkipWs* output.

to_text ()
Transform to plain text.

to_dict ()
Transform to python dict/list.

to_json (***kwargs*)
Transform to JSON format.

class *ckipnlp.util.ws.WsSentenceList* (*initlist=None*)
Bases: *collections.UserList*
A list of word-segmented sentence.

item_class
alias of *WsSentence*

classmethod **from_text** (*text_list*)
Create *WsSentenceList* object from *ckipnlp.ws.CkipWs* output.

Parameters **text_list** (*List[str]*) – A list of sentence from *ckipnlp.ws.CkipWs* output.

to_text ()
Transform to plain text.

to_dict ()
Transform to python dict/list.

to_json (***kwargs*)
Transform to JSON format.

CHAPTER 9

Todo List

Todo: Get information of nodes with pos type PP or GP.
